GENESIS™
Evaporation System

CreativeWater Technology
+ Begin with Genius

Welcome to the Future of Evaporation Systems:

The GENESIS Evaporation System is intended for applications requiring waste water to be processed, but with no, or minimal, clean water recovery requirement.

+ The purpose of the GES is to eliminate waste water at the lowest possible cost.

Unlike the GENESIS Waste Water System, which recovers up to 97% of water content from waste water, the GENESIS Evaporation System focuses exclusively on minimising energy requirement and maximise waste water evaporation.

Users can utilise their waste water storage to minimise rainy day operation, and maximise warm and hot day operation. Thereby delivering waste water reduction at exceptionally low annualised energy cost.

If you have waste water that you need to go away, and you do not require clean water recovery, then the GENESIS Evaporation System is the right tool for the job.

The GENESIS Evaporation System is intended for applications requiring waste water to be processed, but with no, or minimal, clean water recovery requirement.

Technical Information:

Operating energy costs vary with prevailing weather conditions, but on hot days, this system will typically cost 12kWh/kL of evaporation and can cost as little as 6kWh/kL of evaporation of virtually any waste water.

On warm or cold days the system is still able to evaporate waste water but the energy cost is higher. On rainy days the compressor kicks in so that waste water evaporation continues even in rainy weather at the highest energy cost of 45 - 60kWh/kL in a typical situation.
